HD-X_{evo}, Vernet Behringer new drilling milling machine for profiles, will make its world premiere at Euroblech fair. It will replace the HD-X machine and keep its key feature – additional axes with 500 mm stroke, improving working speed and machining possibilities thanks to:

- Rotation speed increased up to 4000rpm for faster carbide drilling
- Even more rigid frame equipped with reinforced spindles, use of prestressed linear guides and ball screw
- Use of new exclusive milling tools allowing the fast processing never ever seen before in this field
- Development of software solution allowing new notching cycles by milling, simultaneous drilling/milling and sawing (if permitted by part drawing) and 3D view of parts to be produced.

And of course:

- Matchless productivity with the possibility to drill non-coaxial holes in flanges and web in hidden time.
- Cycle time reduction with no clamping/unclamping operations between the holes within 500 mm window.
- Highest accuracy between holes: +/-0.1 mm in drilling units positioning.
- Fast and precise scribing with V-scoring system
- Possibility to install in line high performances Behringer band sawing machine
